

Managing Complexity ?

Stefan Thurner

www.complex-systems.meduniwien.ac.at

www.santafe.edu

To manage a system means that you are able to predict the possible outcomes of actions you take

If you can not predict the outcome of management actions - you do not manage or control the system: you are subject to luck, fate, external events

What kind of systems can you predict ?

- Very small ones: physics of a few bodies: planet-sun, quark-quark, rocket-enemy

why ? can manage to handle laws of physics

- Very large ones: gases, solid bodies

why ? do not interact strongly → describe laws of physics with laws of statistics

- Managing CS has been out of scope since beginning of mankind

why ? too large to handle governing 'laws', too small for statistics to work, too interconnected

What are Complex Systems ?

- CS are made from many elements
 - Elements are strongly interacting with each other
 - CS depend on details of the system: who interacts with whom
 - CS often pose chicken-egg problems
- So far: very hard to handle in predictive ways

Why is it so hard to predict complex systems?

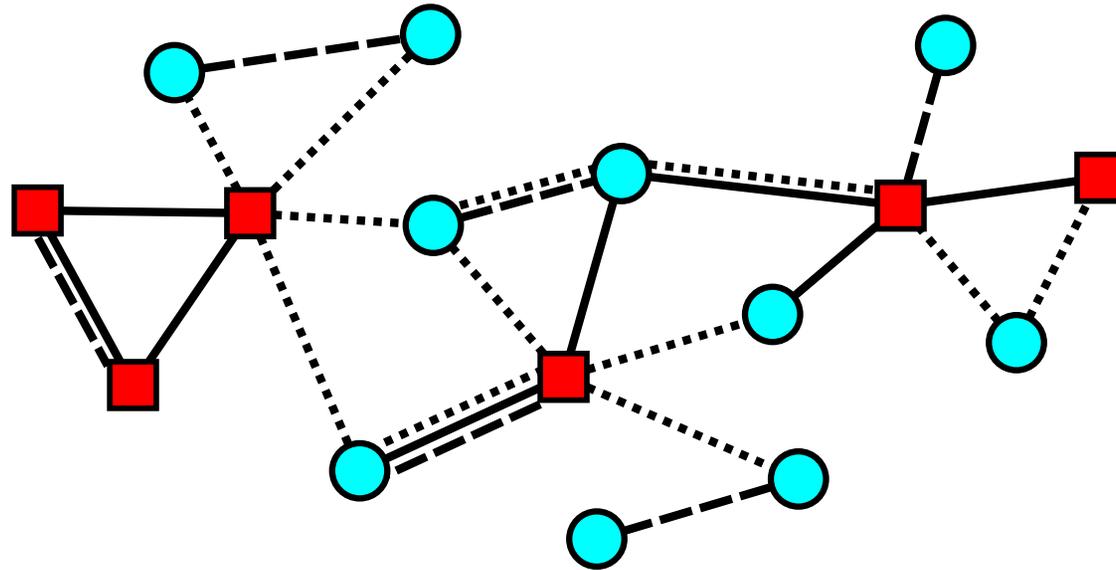

- Mathematical and statistical tools break down
- Too big to handle
- Not enough data available
- No concept of the backbone of CS – networks

Typical Complex Systems

- Living systems
- Social systems
- Economic/financial systems
- Firms + organisations

all these systems are **evolutionary** and are based on **networks**

CS are co-evolving multiplex networks

- States of individuals/firms change as a function of NW interaction
- Network changes as a function of the states of the agents

first point only: physics

second point: **makes it a complex system**: society, eco-system, market, ...

The game changer: The computer + new math

- Network theory: quantify causal processes on networks
- Data availability: electronic fingerprints everywhere
- New statistics: new inference methods and superstatistics
- Storage and computation costs practically nothing

If you do not have all of the above → back to start: can NOT manage CS

If you can map a CS into a dynamical NW → can manage CS

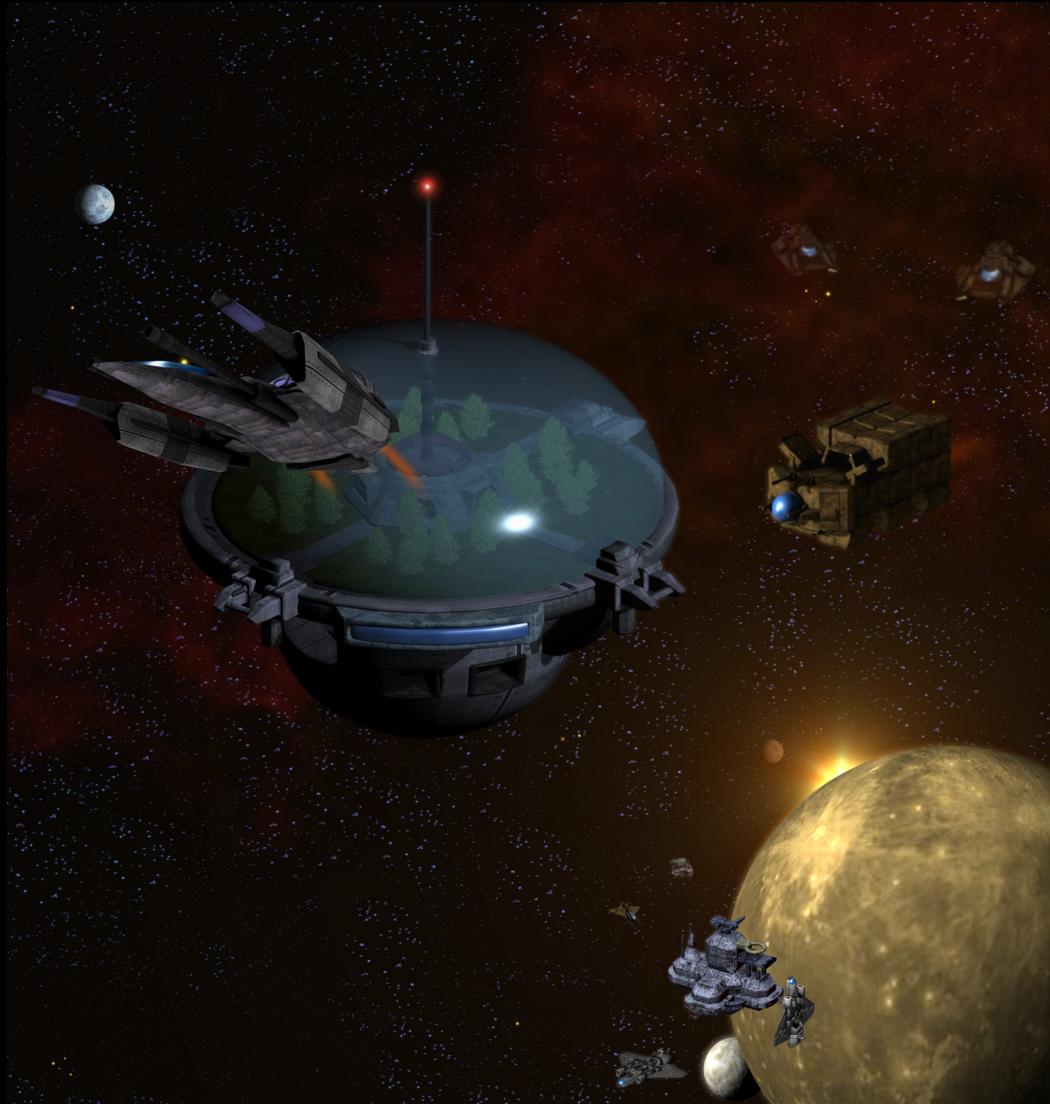

Theory of CS: combination of dynamical systems and NWs

Networks

- Network: connections of points by lines
- Usually NW has **structure + random components**
- Any data that can be stored in database can be represented as network
- Network theory: quantify stability, efficiency, hierarchy, clustering, ...
- Novel mathematics: networks become technically manageable

Networks are dynamical: here sits the devil !

- Networks change over time
- Dynamical processes happen **on** networks
- Dynamical processes happen on networks which change (chicken–egg)
- Networks are not independent: they influence each other → **Multiplex**

Example I

What if we know everything? What can we predict?

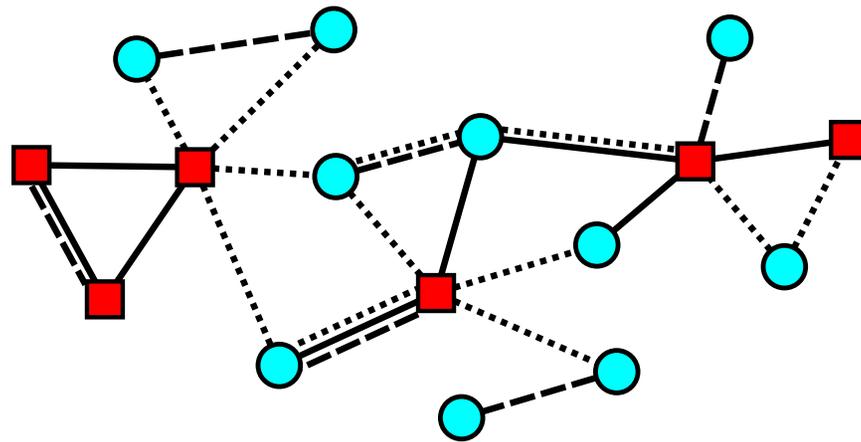

- then we have solved the data problem → good!
- only problem: what to do with all that information?

Massive Multiplayer Online Game – pardus.at a toy for the new data generation

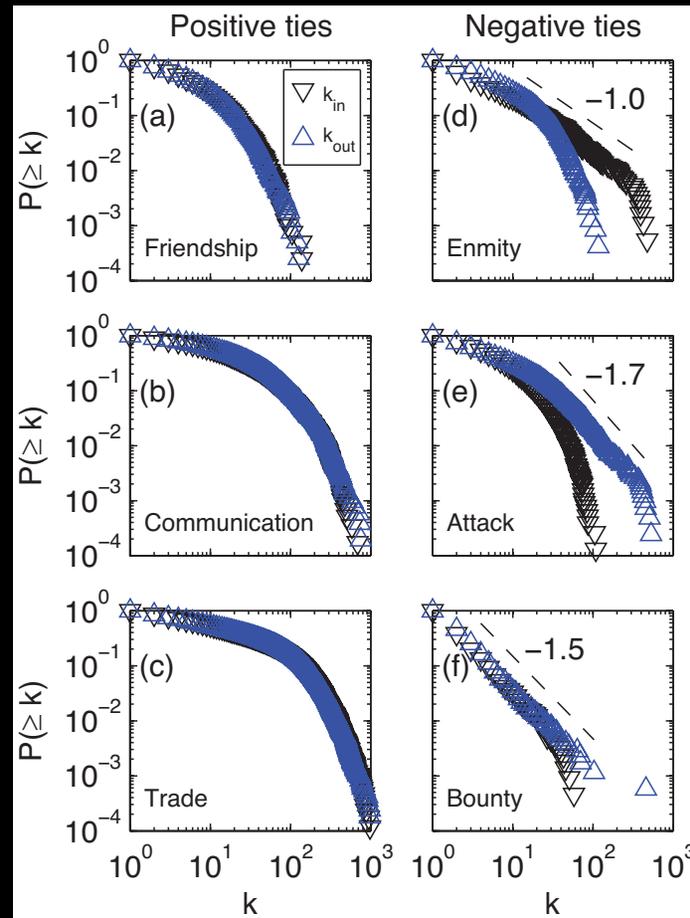

Complete knowledge on a human society

Have **all** data of **all** 500.000 players of **all** of their actions and interactions performed in a 'second life' like virtual world *www.pardus.at*

- have **complete** knowledge of an entire human society
- have time evolution of the co-evolving multiplex **and** states

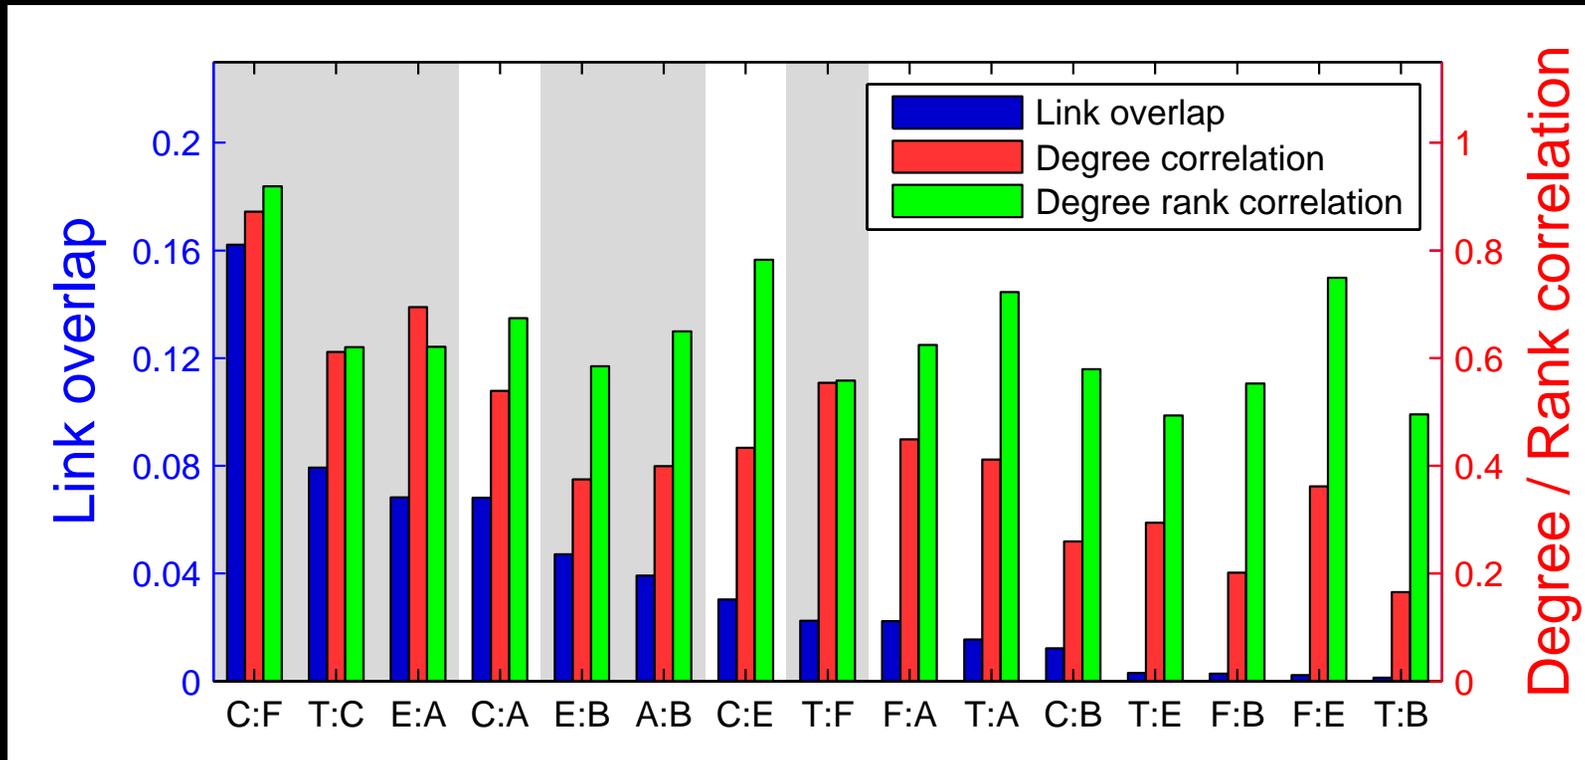

The properties of the subnetworks

- Positive links are highly reciprocal, negative links are not
- Power-law degree distributions indicate aggressive actions
- Positive links cluster

Network-network interactions

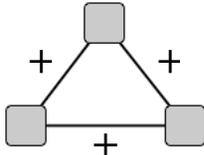

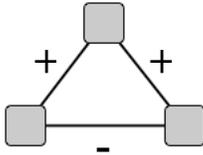

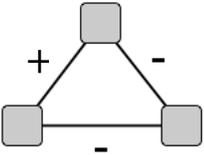

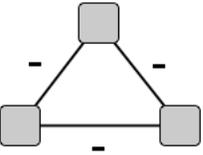

How does one network shape and influence the other?

Proceedings of the National Academy of Science USA (2010)

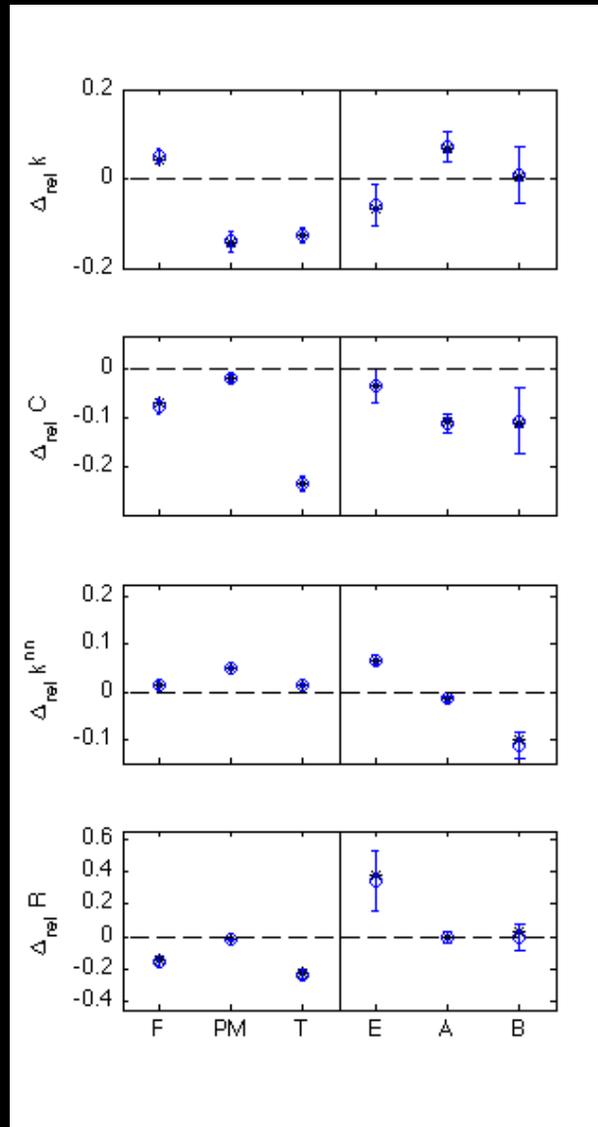

How humans organize to stabilize their social NWs

				
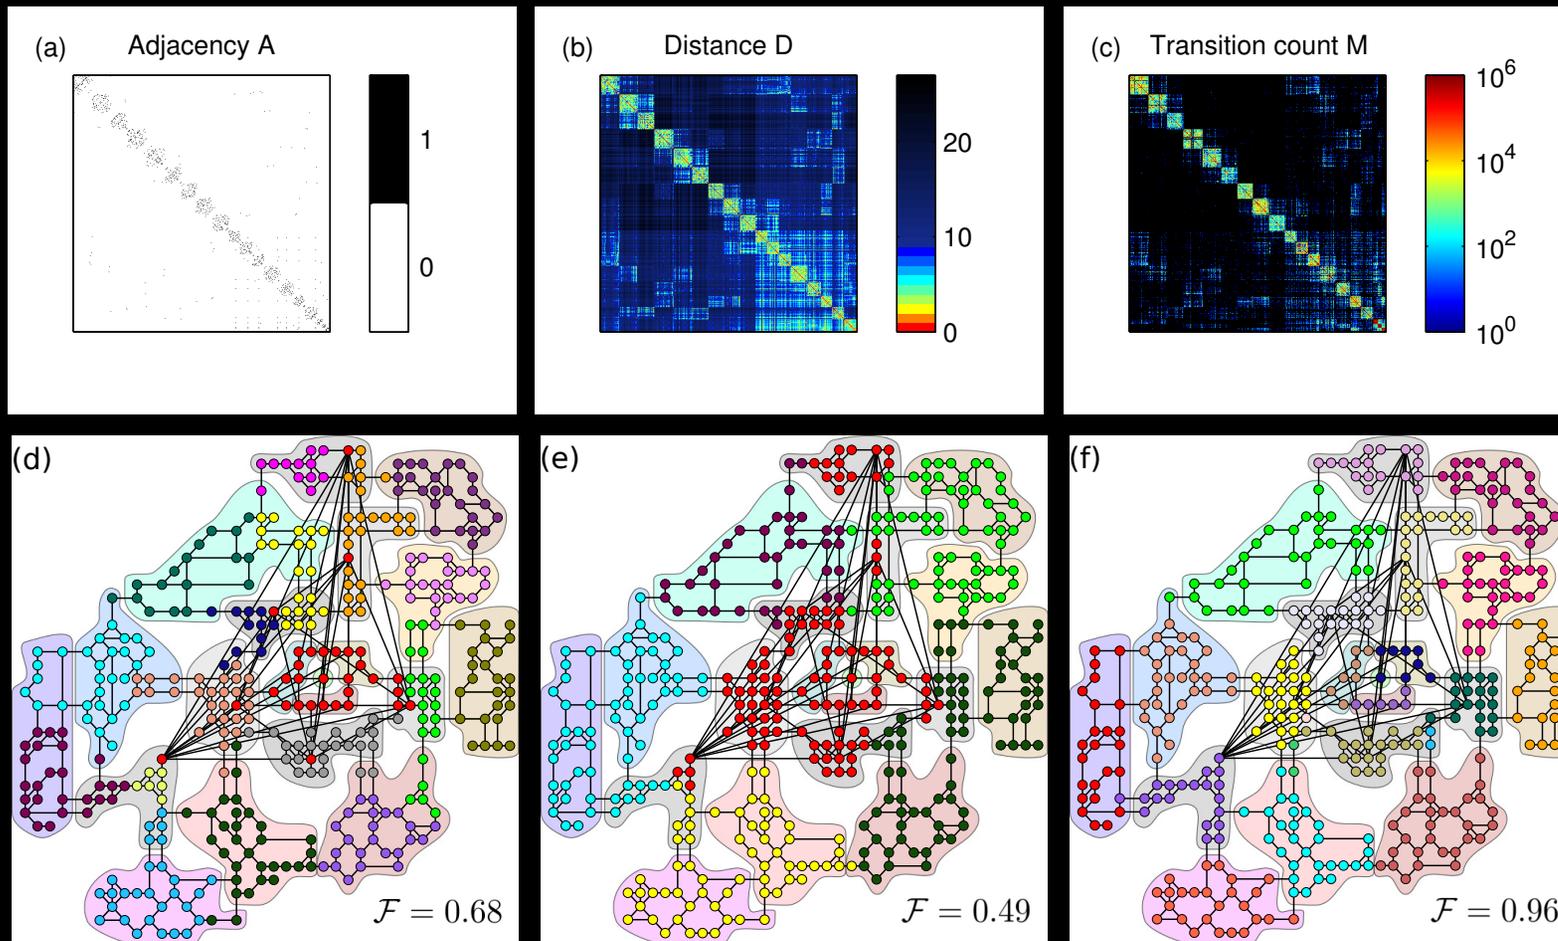

Strong formulation of balance	B	U	B	U
Weak formulation of balance	B	U	B	B
N_{Δ}	26,329	4,428	39,519	8,032
N_{Δ}^{rand}	10,608	30,145	28,545	9,009
ζ	71	-112	47	-5

Social balance theory – test empirically with natural science quality

Gender differences in 'networking'

Predict: Where will you go next ?

Scientific Reports (2012)

Alternative representation of humans – behavioral code

Actions every (human) player can engage in life (game)

C ... communicate

T ... trade

F ... establish a friendship link

X ... remove an enemy link

A ... attack

B ... place a bounty on someone

D ... delete a friendship link

E ... establish an enemy link

→ Analyze the code as if it was the genome

PLoS ONE (2012)

Predict: What is your next action ?

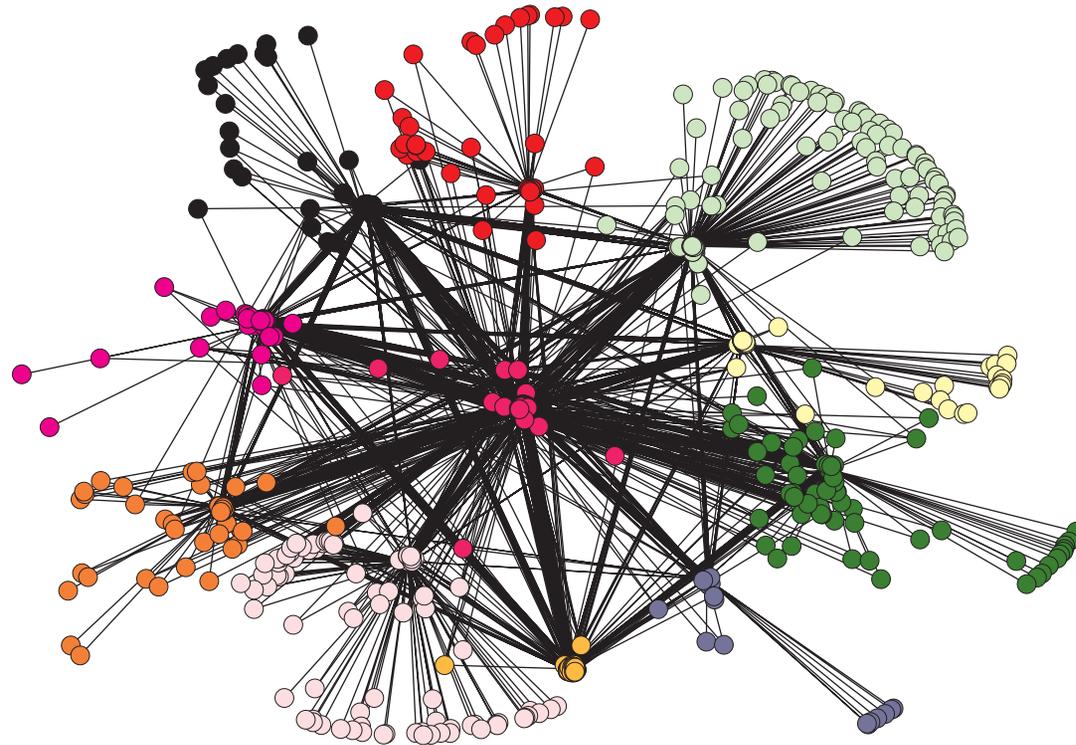

Example II

Complexity in financial networks and systemic-risk management

- If you lend something to somebody: want to know creditworthiness
- In a network can not do that, unless know riskiness of EVERYBODY
- No rational decision making on lending possible without transparency
- Central Banks have almost complete information

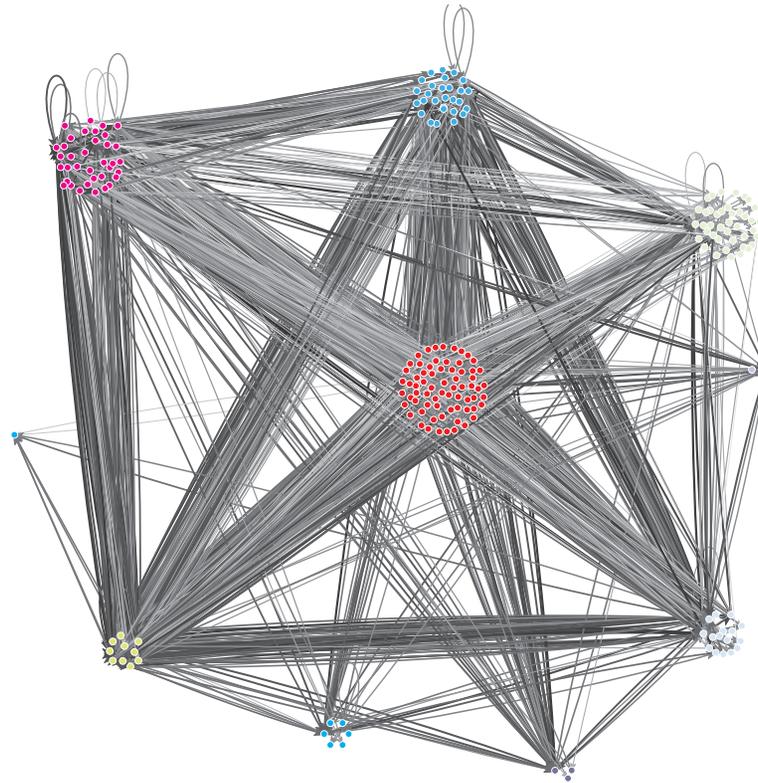

Interbank credit NW of Austria

Asset-liability NW of all Austrian banks, October 2003

Quantitative Finance (2005)

All financial flows between Austrian banks

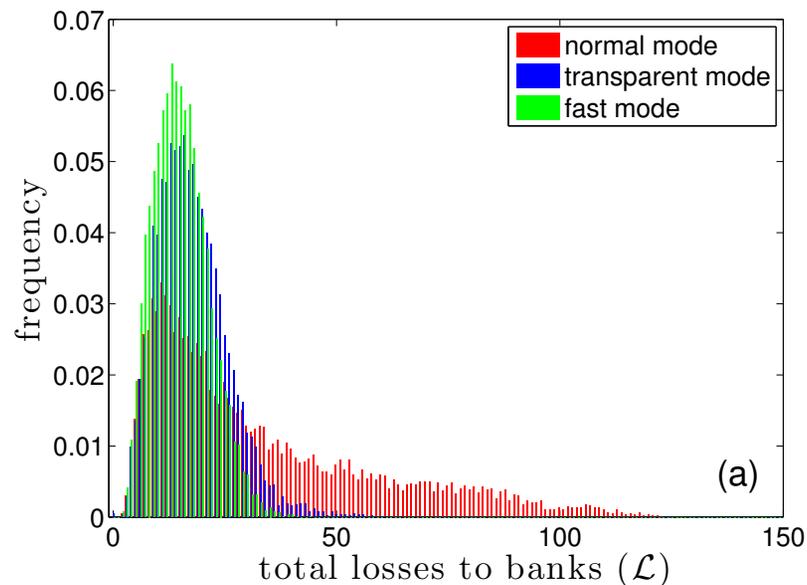

Pajek

aggregated 2005-2006, 211 Banks, 4.187.943 transactions, volume 11.07 trillionEUR

European Physics Journal B (2009)

Financial networks – management of systemic-risk

- With this information → define a systemic risk measure: **DebtRank**
- Can regulate the interbank system that it becomes systemically risk free
- Idea: forbid borrowing from systemically risky banks

<http://www.bloomberg.com/news/2013-02-10/fix-finance-by-shedding-light-on-its-complexities.html>

Example III

What is complex in a firm or corporation ?

- Corporation is an **evolutionary network** of communication-flows
- Management controls these flows and tries to re-arrange the NW
- With and without management: the network evolves = re-arranges

→ CS tools assist to:

- know the network (reality check)
- find ways to re-arrange it (optimize)
- monitor its change after managerial intervention

Note: it is not easy to tell a network how to re-arrange !

Why CS in corporations?

Imagine new CEO entering a firm with say more than 1000 employees

- Knows organigram. Knows what departments **should** do + hierarchy
- **Does not** know: what departments are **in reality**
- Are departments structured **in reality** as the CEO thinks they are?
- How hierarchical is the firm **in reality**?
- Do re-structuring interventions work?
- Do optimal solutions to organization structure exist, given **real** structure

→ **Answer to this: communication flows**

Communication: the nervous system of a firm

- Telephone bill: every call = one line

ID caller | dpt caller | ID called | dpt called | time | duration

```
10000 50 50404 7 16 10 2009 14 01 00 00 14
10003 50 50091 2 04 11 2009 10 28 00 00 04
10003 50 50032 2 04 11 2009 16 27 00 01 10
10004 50 50404 7 30 09 2009 08 27 00 02 58
```

.....

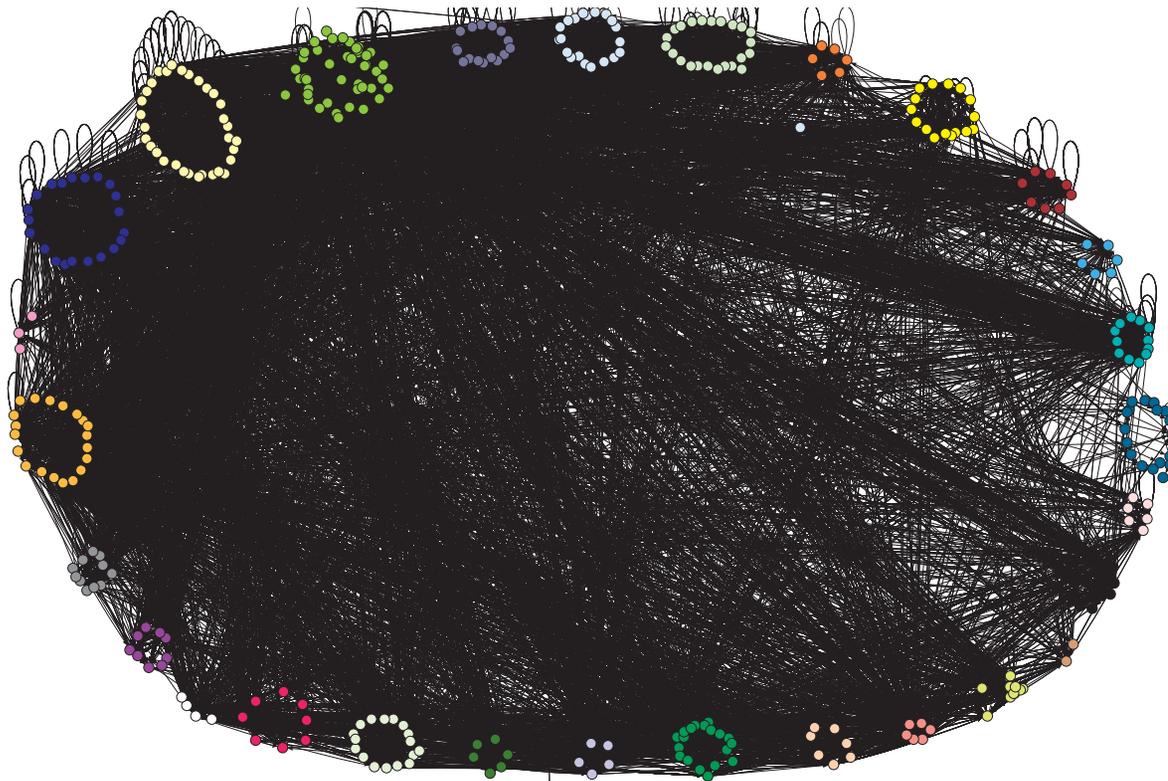

- emails: log-files on server: every mail = one line

ID Sender | dpt sender | ID recipient | dpt recipient | kB | time sent

```
100001 1 508193 50 9486 2009 11 03 07 13 15

100001 1 509485 50 3122 2009 11 03 13 27 11
```

.....

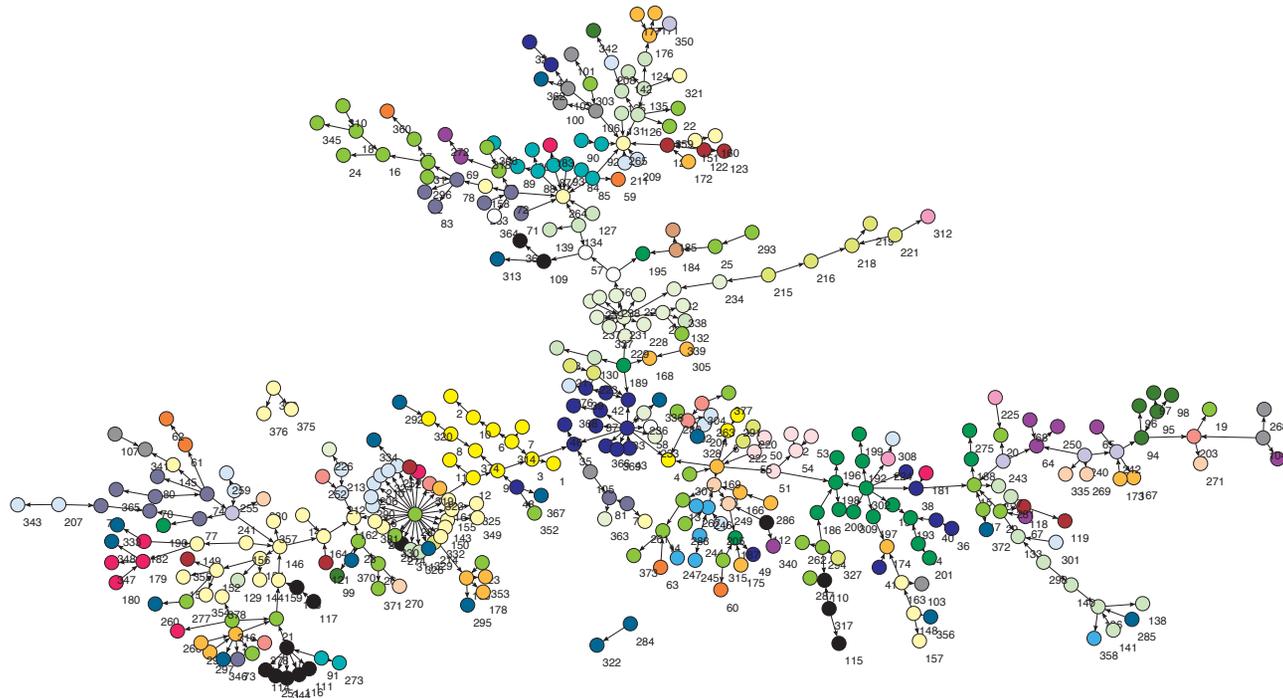

emails of corporation, december 2011

- what do we see? nothing ! → network theory

with kind permission from Günther Weiss

emails: max. spanning tree – departments, dec 2011

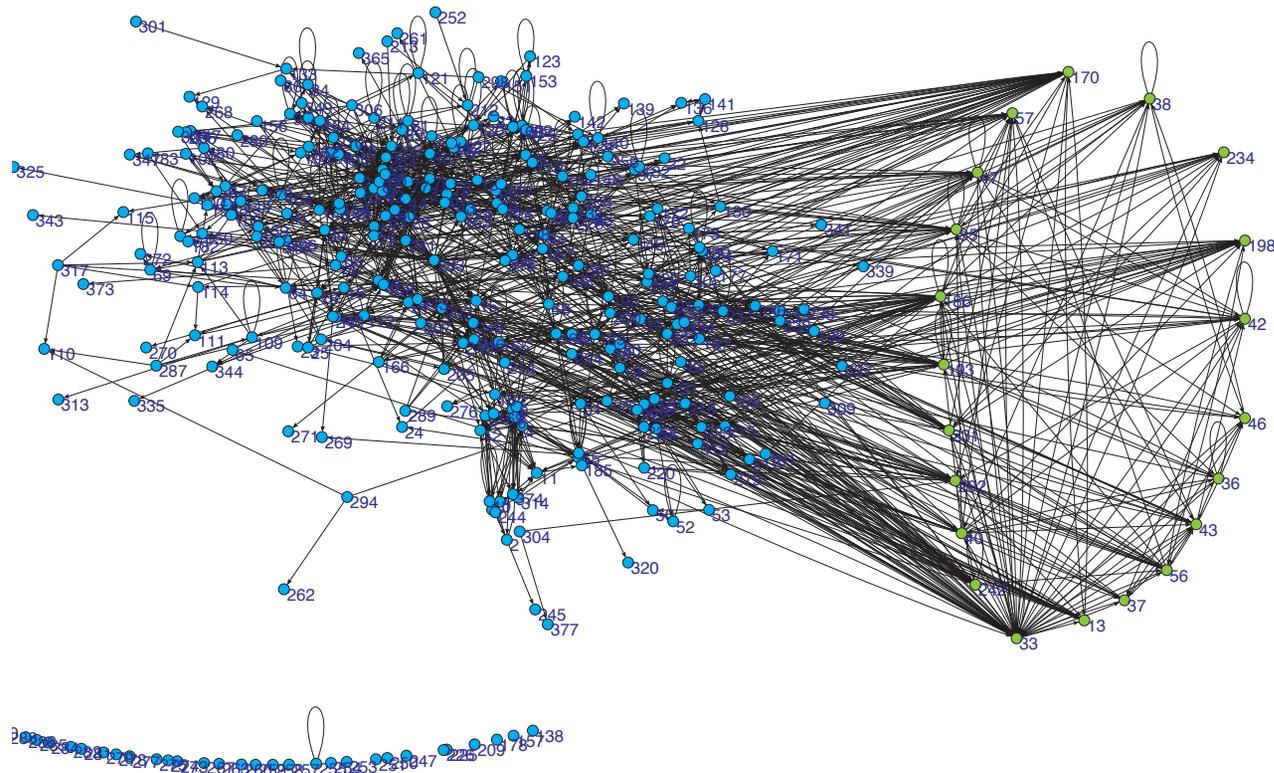

- Support to questions: what is state of the firm – is restructuring needed?
- Degree of clustering → rethink dept. structure? monitor restructuring?

with kind permission from Günther Weiss

Destroy the core and you collapse !

- Loss of **core** often leads to collapse of network

with kind permission from Günther Weiss

Conclusion

- Complexity arises through inter-connectedness: networks
- Science: complexity catastrophe possible: quick & drastic changes
- If can map CS to dynamical co-evolving NW → can manage it
- Can manage **systemic-risk** (risk of drastic change - collapse)

Conclusion II message for strategic management

- Communication-network monitoring
 - know your corporation
 - restructure departments
 - monitor restructuring events
- Core-detection of a corporation
 - verify keystone-employees
 - identify potentials easy to realize: AC cycle analysis
 - identify cores
- Problems with these techniques:
 - Legal issues, privacy rights, anonymization, and data storage
